Executive Overview

Reducing Churn with Smarter Outreach

Our client, WellCo, is experiencing increased member churn and seeks our assistance in reducing it.

- They invest significant time in calls, emails, and messages to keep members engaged and reduce churn.
- Today outreach is loosely prioritized, so they contact many members who would stay anyway and miss some who are about to leave.
- Outreach capacity is limited, so every contact should go to a member they can still influence.
- Key question: with a fixed outreach budget, who should we contact first to prevent the most member churn?

Uplift-based Outreach

Persuadables – renew because we reach out. This is where outreach really pays off.

Sure Things – renew with or without outreach, so extra effort adds little value.

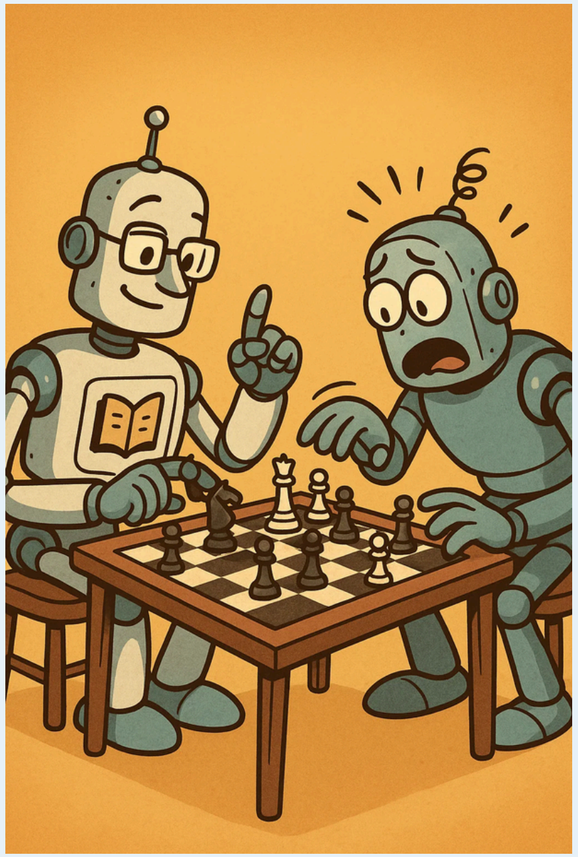

Lost Causes – don't renew either way, so outreach is mostly wasted.

Sleeping Dogs – would renew on their own, but outreach can actually push them away.

Prioritizing Members Who Can Be Persuaded

This approach emphasizes targeting persuadable members who are most likely to respond positively to outreach, optimizing our resources and maximizing churn prevention efforts effectively.

Churn Prevention Impact

- Our uplift model is better than baseline at ranking who to contact ,so the same outreach capacity is used more intelligently.
- At 25% outreach capacity, for 2500 members our model prevents about 88 more churn events than baseline
- this is about a 265% lift vs baseline – roughly 2.7× more saved customers for the same outreach budget.
- Put simply, that's about 14 additional saved customers per 100 outreach calls compared with
- The average impact of outreach is modest, so who we call matters a lot: the model focuses outreach on members where it actually reduces churn instead of wasting effort on low- or negative-impact members.

Pilot Plan

Start Pilot

Group A begins using the current outreach processes for comparison.

Mid Pilot

Group B implements the uplift-based ranking for outreach efforts.

End Pilot

Analyze KPIs and determine effectiveness to scale the approach.
